

Acceptance Testing

UAT Execution & Report Submission

Date	04 July 2026
Team ID	SWTID-2026-2662
Project Name	AI Powered Debt Relief & Financial Recovery Platform
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to record the User Acceptance Testing (UAT) carried out for the AI Powered Debt Relief & Financial Recovery Platform (FinRelief AI) prior to final submission. Rather than a separately staged formal QA cycle, UAT for this project took the form of each team member independently setting up and running the application end-to-end on their own machine, verifying that the environment could be configured correctly and that all implemented features behaved as expected.

2. Setup & Environment Testing

This section documents the real setup issues encountered by the team while installing and running the application, and how each was resolved.

Team Member(s)	Issue Encountered	Resolution
Hema Sai Sree (Team Lead)	Environment creation failed initially due to a Python version incompatibility — the installed Python version did not match the version pinned in runtime.txt (Python 3.11.0).	Installed/switched to Python 3.11 and recreated the virtual environment. The application ran successfully afterward.
Remaining team members	Encountered code-level errors when first running the application on their own machines after cloning the repository.	Identified and fixed the errors with the help of the VS Code AI coding assistant. The application ran successfully once the fixes were applied.

On average, it took approximately 20 minutes per machine to go from a fresh repository clone to a fully running application (backend and frontend), including environment setup, dependency installation, and resolving the issues above. No issues were traced back to the application's core logic — both problems were environment/setup-related rather than defects in the codebase itself.

3. Feature Verification (Post-Setup)

Once each team member's environment was correctly configured, the following core features were manually verified end-to-end:

Feature	Status	Notes
User Authentication & Dashboard	Verified	Registration, login, and dashboard financial overview worked correctly.
Financial Health Analysis	Verified	EMI ratio, debt-to-income ratio, and stress level calculated and displayed correctly.
Settlement Prediction Engine	Verified	Settlement percentage and risk category generated correctly from loan data.
AI Negotiation Letter Generator	Verified	Negotiation letters generated successfully via Gemini AI.
Loan Management & AI History	Verified	Adding, viewing, and deleting loans, and viewing AI history, worked as expected.
Database Integration	Verified	Data persisted correctly across sessions via SQLite/SQLAlchemy.

4. UAT Conclusion

UAT for this project was conducted informally by the development team itself rather than by a separate testing team with a formal, severity-tracked defect log. The issues identified were limited to environment setup (a Python version mismatch and minor code errors on first run), both of which were resolved before the application was demonstrated, and neither of which affected the application's core logic once configured correctly. After setup, all core features listed above were manually verified as working correctly across every team member's machine.

Note: This report reflects the actual, informal testing performed by the team. It does not include a formal severity-classified defect log (Severity 1–4) or a large-scale test case matrix, as no dedicated QA phase with that level of structure was carried out for this project. If a more formal UAT process is required, the team recommends a follow-up testing pass with a dedicated tester, a structured test case list, and a defect tracker.
